mulTree

build passing DOI 10.5281/zenodo.31742

This package is based on the MCMCglmm package and runs a MCMCglmm analysis on multiple trees. This code has been used prior to this package release in Healy et. al. (2014). Please send me an email or a pull request if you find/have any issue using this package.

Installing mulTree

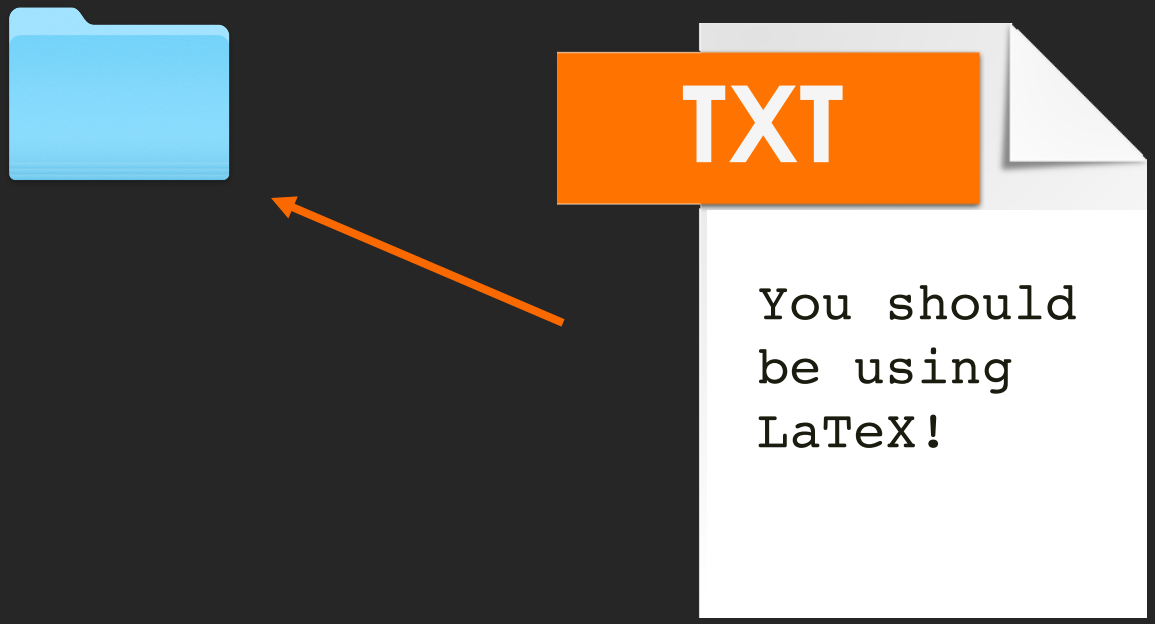
```
if(!require(devtools)) install.packages("devtools")
library(devtools)
install_github("TGuillerme/mulTree", ref = "release")
library(mulTree)
```

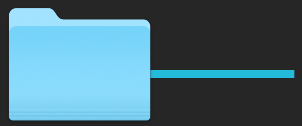
The following installs the latest released version (see patch notes below). For the piping hot development version (not recommended), replace the `ref="release"` option by `ref="master"`. If you're using the `master` branch, see the latest developement in the patch note.

Note that many code architecture have changed from version `1.2` onwards (including proper testing!). If you wish to use older "clunky" version, you can download former releases here.

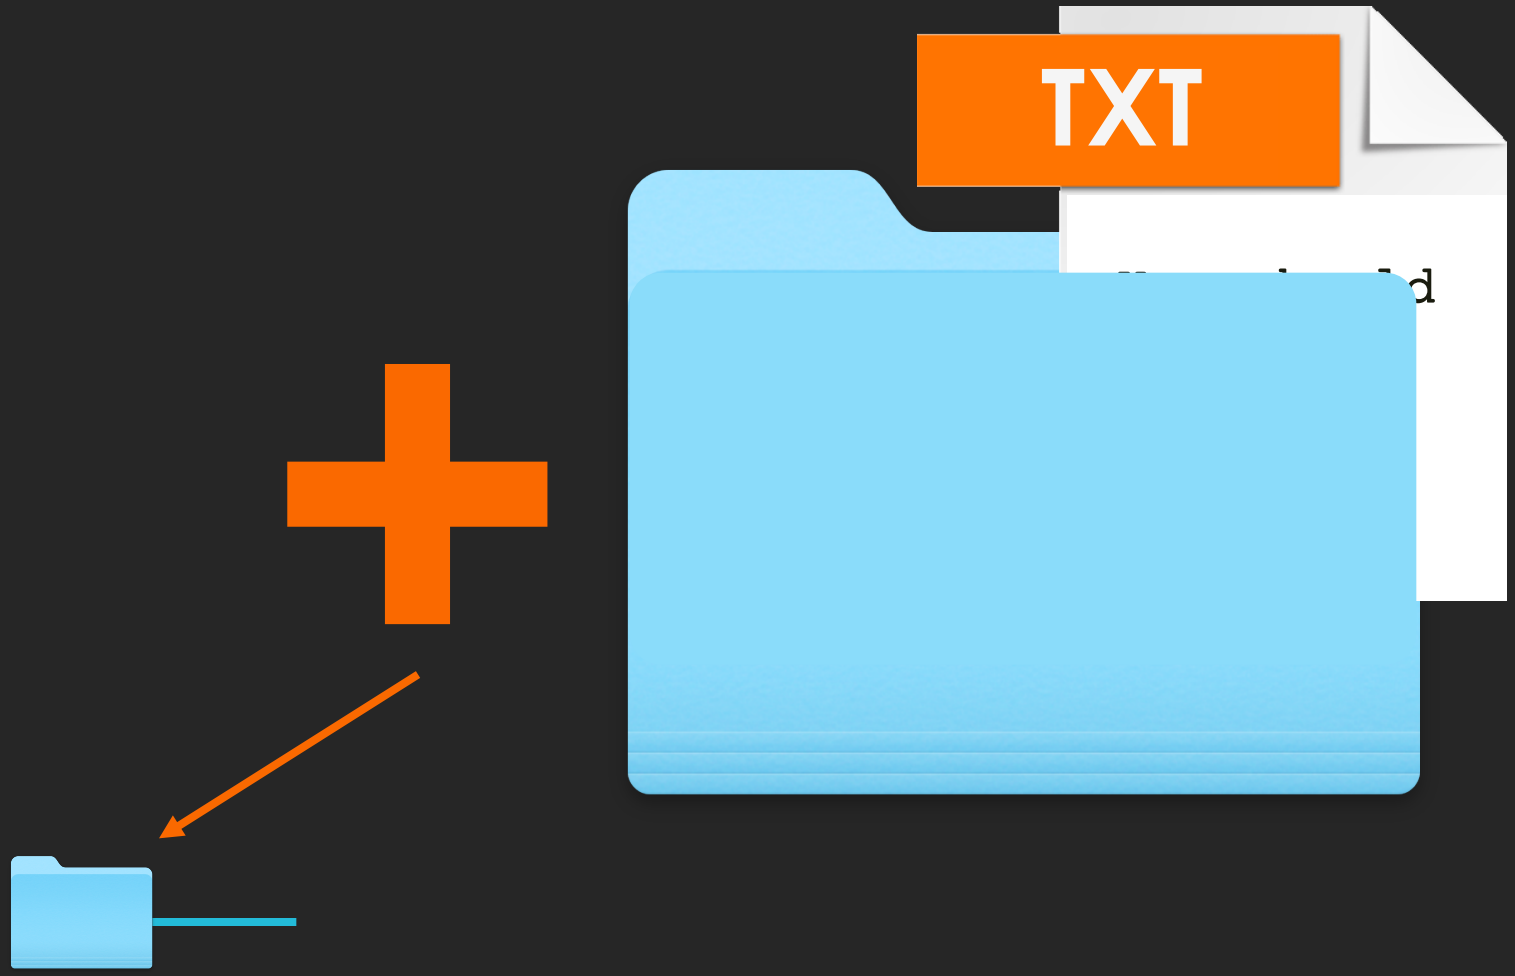
From the GitHub GUI, create a new repository (folder)

Find the repository on your machine and create add a text file within

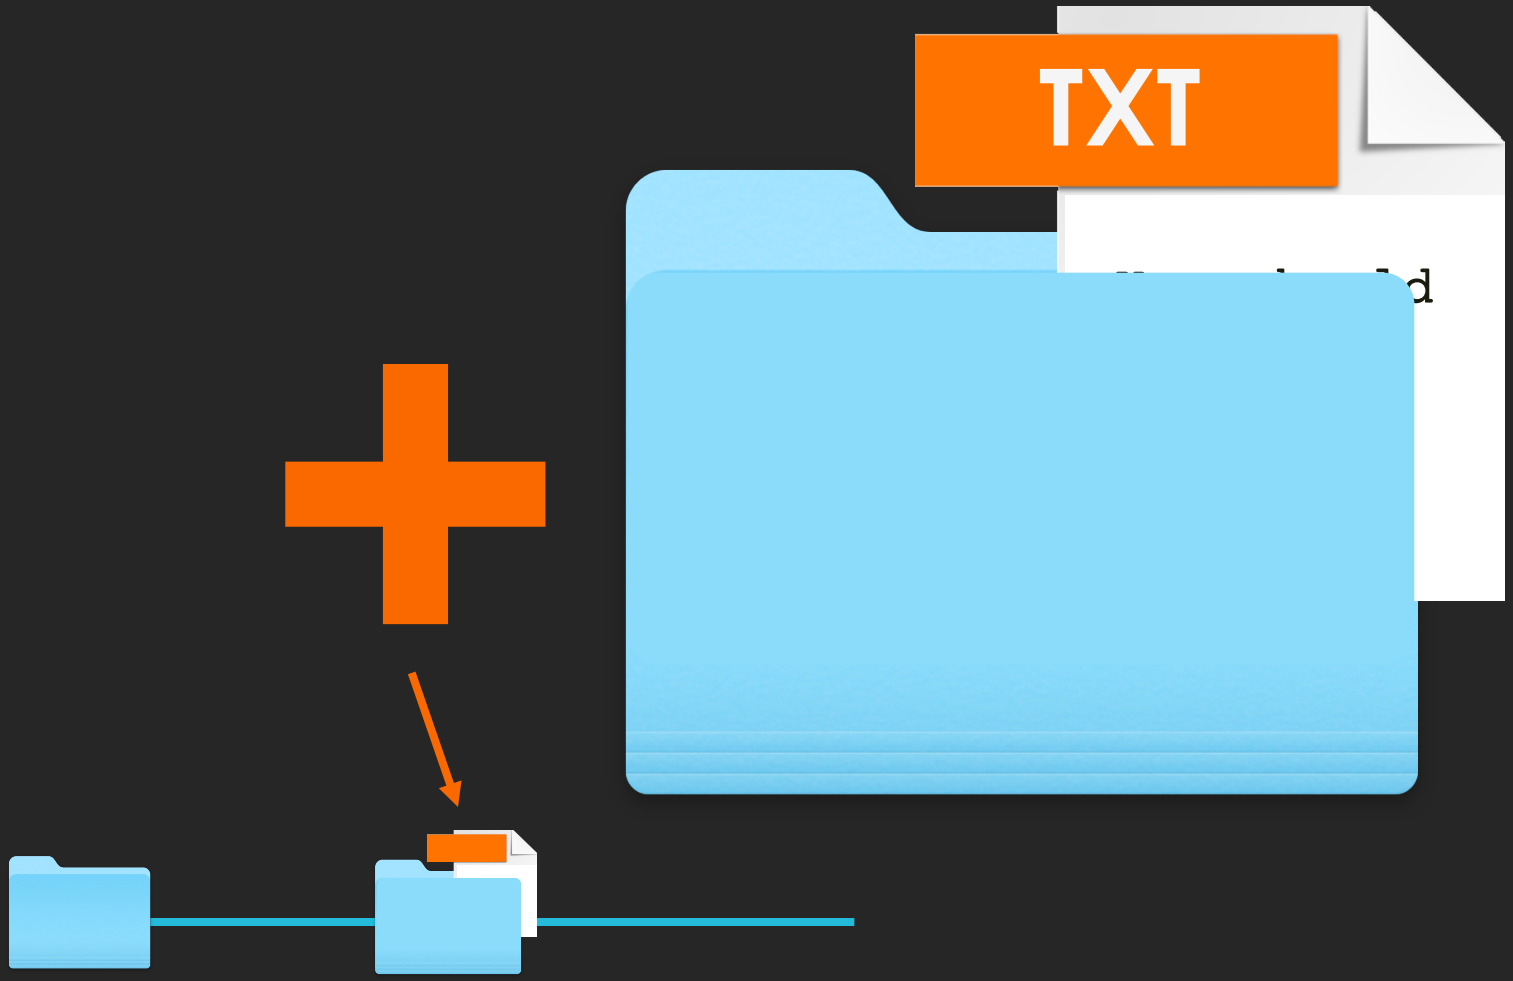




Commit and push the new change with a sensible name.



Commit the new change with a sensible name.



Modify and commit/push your text file.
